

### Description

The DZEANTU-020B080 digital servo drive is designed to drive brushed and brushless servomotors from a compact form factor ideal for embedded applications. This fully digital drive operates in torque, velocity, or position mode and employs Space Vector Modulation (SVM), which results in higher bus voltage utilization and reduced heat dissipation compared to traditional PWM. The drive can be configured for a variety of external command signals. Commands can also be configured using the drive's built-in Motion Engine, an internal motion controller used with distributed motion applications. In addition to motor control, this drive features dedicated and programmable digital and analog inputs and outputs to enhance interfacing with external controllers and devices.

DZEANTU-020B080 drives feature an EtherCAT® interface for network communication using CANopen over EtherCAT (CoE), and USB connectivity for drive configuration and setup. Drive commissioning is accomplished using DriveWare® 7, available for download at <a href="https://www.a-m-c.com">www.a-m-c.com</a>. All drive and motor parameters are stored in non-volatile memory.

The DZEANTU-020B080 also supports *ADVANCED* Motion Controls' exclusive 'DxM' technology which allows connectivity of up to 3 DZSANTU-020B080 drives to a single DZEANTU-020B080 on an EtherCAT network. DZSANTU-020B080 drives receive commands from a DZEANTU-020B080 over a high-speed communication interface, allowing for up to 4 axes of servo drive control from a single EtherCAT connection.

Power Range		
Peak Current	20 A (14.1 A <sub>RMS</sub> )	
Continuous Current	10 A (10 A <sub>RMS</sub> )	
Supply Voltage	18 - 80 VDC	

### **Features**

- Synchronization using Distributed Clocks
- Position Cycle Times down to 100μs
- Four Quadrant Regenerative Operation
- ▲ Fully Digital State-of-the-art Design
- Programmable Gain Settings
- Fully Configurable Current, Voltage, Velocity and Position Limits

- ▲ PIDF Velocity Loop
- ▲ PID + FF Position Loop
- ▲ 12-bit Analog to Digital Hardware
- Supports ADVANCED Motion Controls 'DxM' Technology
- On-the-Fly Mode Switching
- On-the-Fly Gain Set Switching
- ▲ Space Vector Modulation (SVM) Technology

### MODES OF OPERATION

- Profile Current
- Profile Velocity
- Profile Position
- Cyclic Synchronous Current Mode
- Cyclic Synchronous Velocity Mode
- Cyclic Synchronous Position Mode

# **COMMAND SOURCE**

- ±10 V Analog
- Encoder Following
- Over the Network
- Sequencing
- Indexing
- Jogging

# **COMPLIANCES & AGENCY APPROVALS**

- UL
- cUL
- CE Class A (LVD)
- CE Class A (EMC)
- RoHS

# FEEDBACK SUPPORTED (FIRMWARE DEPENDENT)

- Halls
- Incremental Encoder
- Auxiliary Incremental Encoder
- 1Vp-p Sine/Cosine Encoder (see note 5 on page 3)
- Absolute Encoder (Heidenhain EnDat® or Stegmann Hiperface® or BiSS C-Mode)
- ±10 VDC Position
- Tachometer (±10 VDC)

# INPUTS/OUTPUTS

- 1 Programmable Analog Input (12-bit Resolution)
- 5 Programmable Digital Inputs (Differential)
- 3 Programmable Digital Inputs (Single-Ended)
- 5 Programmable Digital Outputs (Single-Ended)
- **ELECTROMATE**3 High Speed Captures

P1 Connector - 96-pin, 1.27 mm spaced, dual-row header		-	96-pin, 1.27 mm spaced, dual-row header	
P2 Connector - 50-pin, 2.0 mm spaced, dual-row header				

### Notes

- Capable of supplying drive rated peak current for 2 seconds with 10 second foldback to continuous value. Longer times are possible with lower current limits.
- Continuous  $A_{\text{rms}}$  value attainable when RMS Charge-Based Limiting is used.
- Lower inductance is acceptable for bus voltages well below maximum. Use external inductance to meet requirements. EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.
- 5. 6. Contact ADVANCED Motion Controls for 1Vp-p Sine/Cosine Encoder feedback availability.
- Additional cooling and/or heatsink may be required to achieve rated performance.

Sold & Serviced By: **ELECTROMATE**

### Pin Details

ADDRO (P1-6); ADDR1 (P1-4)

ADDRO, as well as ADDR1, are used to set the EtherCAT drive Station Alias (address). Note that drives on an EtherCAT network will be given an address automatically based on proximity to the host. Setting the Station Alias manually is optional, and only necessary if a fixed address is required. The Station Alias is set by applying a fixed voltage to the ADDRO and ADDR1 pins to determine a node ID. ADDRO sets the lower 4 bits of the address, and ADDR1 sets the upper 4 bits of the address. The values for ADDRO and ADDR1 are always integer multiples of 1/5 V within the range 0-3 V. Examples of the voltages required to set certain node ID's are given in the table below.

ADDR1 Voltage (Volts)	ADDR1 Value (Hex)	ADDRO Voltage (Volts)	ADDR0 Value (Hex)	Node ID (Decimal)
0	0	0	0	000
0	0	0.2	1	001
0	0	0.4	2	002
3	F	2.6	D	253
3	F	2.8	E	254
3	F	3	F	255

AMP STATUS LED+ (P1-46); AMP STATUS LED- (P1-44)

AMP STATUS LED+/- provide power bridge status outputs that can be used with either a single Bi-Directional LED or two Uni-Directional LEDs, depending on the user configuration (reference the DZEANTU Hardware Installation Manual for the recommended wiring diagram, available for download at <a href="https://www.a-m-c.com">www.a-m-c.com</a>). Status LED output functionality is as follows:

AMP STATUS LED+/- Functionality		
Drive State Pin Output State		
Power Bridge Enabled	AMP STATUS LED- = High; AMP STATUS LED+ = LOW	
Power Bridge Disabled (Fault)  AMP STATUS LED + = HIGH; AMP STATUS LED- = LOW		
No Power Applied to Drive	AMP STATUS LED +/- = LOW	

LINK/ACT IN (P1-96); LINK/ACT OUT (P1-94); STATUS/ERR+/- (P1-93/95)

The LINK/ACT IN, LINK/ACT OUT, and STATUS/ERR pins serve as EtherCAT network indicators. On a standard RJ-45 connector used with EtherCAT network topology, the typical EtherCAT network indicator LED locations are as shown in the below diagrams. Note that DZEANTU drives feature signals for connection to LEDs on an RJ-45 connector, but the connector itself is not included on the drive. The MC4XDZPO1 and MC1XDZPEO1 Mounting Cards feature a built-in RJ-45 connector with LEDs for this purpose.

LINK/ACT IN and LINK/ACT OUT are used to drive the convession of the two STATUS/ERR pins are used to drive a bi-color status/etc. In and LINK OUT LEDs on a typical RJ-45 connector. The two STATUS/ERR pins are used to drive a bi-color status/etc. The two STATUS/ERR pins are used to drive a bi-color status/etc.

configuration (reference the DZEANTU Hardware Installation Manual for the recommended wiring diagram, available for download at <a href="https://www.a-m-c.com">www.a-m-c.com</a>). The LED Function Protocol tables below describe typical LED functionality.

# **Communication LEDs Function Protocol**

LINK/ACT LEDS		
LED State Description		
Green – On	- On Valid Link - No Activity	
Green – Flickering	Valid Link - Network Activity	
Off	Invalid Link	

STATUS LED		
LED State	Description	
Green – On	The device is in the state OPERATIONAL	
Green – Blinking (2.5Hz – 200ms on and 200ms off)	The device is in the state PRE-OPERATIONAL	
Green – Single Flash (200ms flash followed by 1000ms off)	The device is in state SAFE-OPERATIONAL	
Green – Flickering (10Hz – 50ms on and 50ms off)	The device is booting and has not yet entered the INIT state or The device is in state BOOTSTRAP or Firmware download operation in progress	
Off	The device is in state INIT	

	ERROR LED	
LED State	Description	Example
Red – On	A PDI Watchdog timeout has occurred.	Application controller is not responding anymore.
Red – Blinking (2.5Hz – 200ms on and 200ms off)	General Configuration Error.	State change commanded by master is impossible due to register or object settings.
Red – Flickering (10Hz – 50ms on and 50ms off)	Booting Error was detected. INIT state reached, but parameter "Change" in the AL status register is set to 0x01:change/error	Checksum Error in Flash Memory.
Red – Single Flash (200ms flash followed by 1000ms off)	The slave device application has changed the EtherCAT state autonomously: Parameter "Change" in the AL status register is set to 0x01:change/error.	Synchronization error; device enters SAFE- OPERATIONAL automatically
Red – Double Flash (Two 200ms flashes separated by 200ms off, followed by 1000ms off)	An application Watchdog timeout has occurred.	Sync Manager Watchdog timeout.

# PART NUMBERING INFORMATION

DigiFlex® Performance™ series of products are available in many configurations. Note that not all possible part number combinations are offered as standard drives. All models listed in the selection tables of the website are readily available, standard product offerings.

ADVANCED Motion Controls also has the capability to promptly develop and deliver specified products for OEMs with volume requests. Our Applications and Engineering Departments will work closely with your design team through all stages of development in order to provide the best servo drive solution for your system. Equipped with on-site manufacturing for quick-turn customs capabilities, ADVANCED Motion Controls utilizes our years of engineering and manufacturing expertise to decrease your costs and time-to-market while increasing system quality and reliability.

# **Examples of Customized Products**

- Optimized Footprint
- ✓ Private Label Software
- ▲ OEM Specified Connectors
- No Outer Case
- ✓ Increased Current Resolution
- ✓ Increased Temperature Range
- ▲ Custom Control Interface
- ▲ Integrated System I/O

- ▲ Tailored Project File
- Silkscreen Branding
- Optimized Base Plate
- ▲ Increased Current Limits
- ▲ Increased Voltage Range
- Conformal Coating
- ▲ Multi-Axis Configurations
- Reduced Profile Size and Weight

Feel free to contact Applications Engineering for further information and details.

## **Available Accessories**

ADVANCED Motion Controls offers a variety of accessories designed to facilitate drive integration into a servo system. Visit <a href="www.a-m-c.com">www.a-m-c.com</a> to see which accessories will assist with your application design and implementation.
