PS-24 Controller

Model PS-241/PS-242
DC24V Power supply for ROBO Cylinder

Features

1 Maximum Momentary Output of 17A
Up to 17A of maximum momentary output current is possible at 8.5A rated output current. This lets you select an appropriate power-supply capacity based on the total rated current of actuators, without having to consider the maximum momentary current that may be generated by the actuators during acceleration. Because you no longer need to use an expensive high-capacity power supply, cost can be reduced substantially.

* The maximum momentary output current must be considered if the actuator operating conditions are tight. See the “Selection Guide” at right for details.

2 Parallel Operation Enabled
Up to 5 units can be operated in parallel. Therefore, even if the power capacity is insufficient with one unit, this can be easily remedied by adding one unit, without the need to replace the unit with a larger capacity power supply.

3 Load Detection Function
Load percentage can be detected by the RDY (Ready) display lamp and the RDY output signal.

Selection target Number of actuators connected
When selecting a power-supply unit for operating multiple actuators, normally a unit with a capacity equal to or exceeding the total maximum current of all actuators is chosen. However, actuators generate their maximum current only momentarily during acceleration, etc., and in many cases the power-supply is over-specified.

On the other hand, the PS-24 power supply provides the following advantages:
1. Supporting maximum momentary current of up to twice the rated current.
2. If you need more power-supply capacity, you can simply add an extra unit or units.

The above features let you select an optimal power-supply capacity.

Number of Power-Supply Units
Basically, how many power-supply units you need should be determined in such a way that the total rated current of all actuators will remain within the rated current of the PS-24. If the load condition is tight, however, the power-supply capacity may still become inadequate. In such cases, add an extra power-supply units.

“Severe load conditions” refers to:
- Large load (load is approaching the rated load capacity)
- High acceleration/deceleration
- High speed
- Simultaneous operation of multiple axes
- Use of the RCS2-SRA7 series (structurally these actuators allow maximum current to flow for a longer period).

Table 1. PS-24 Rated Current and Allowable Maximum Momentary Electric Current

<table>
<thead>
<tr>
<th>No. of Connected units</th>

* AC100V input type should be connected to RCP3/RCP2 (all models) for combined use.

Names

1 Ready indicating light (RDY)
2 Level setting dial for over load detection (LF.DET)
3 Ready output signal (RDYOUT)
4 +24V Output terminal (+24V)
5 0V Output terminal (0V)
6 Frame ground terminal (FG)
7 Terminal for ground.
8 AC input terminal (AC (N))
9 AC input terminal (AC100V) (AC100 (L))
10 AC input terminal (AC200V) (AC200 (L))
11 AC input terminal (AC200V) (AC200 (L))
12 AC100V input type should be connected to 6 and 7 interval, AC200V to 8 and 10. Unavailable for combined use.

DC24V Power Supply

PS-24

- The PS-24 is not a constant voltage power supply. The output voltage changes with the load (voltage decreases according to the load percentage). Therefore, do not connect any equipment other than ROBO Cylinder actuators.
- Up to 5 units can be operated in parallel. Do not use any power supplies other than the PS-24 at the same time for parallel operation.
- Note that serial operations are not possible.
- As a rule, when operating multiple units in a row, allow at least 20mm space between each power supply.
- This is a natural air-cooled power supply. Please give due consideration to natural convection so that heat does not build up around the power supply.
- The case of this product also has a dissipating effect. Do not touch the case after installation as it may result in severe burns.

Caution:
